

identity, a cleft structure is required. However, the remnant clearly shows connectivity effects (viz. case and P-stranding), which are typically attributed to isomorphic structure in the ellipsis site (see Saab (2015) and Messick et al. (2016) on similar data with DOM in Spanish). It is this conflict that leads to the ellipsis site in unconditional sluicing being ineffable. As such, the actual content of the ellipsis site in such constructions remains rather mysterious.
